

1. The size of a vector is the root of the squared sum of all it's components

$$|r| = \sqrt{|r_1|^2 + |r_2|^2} = \sqrt{\sum_i^d |r_i|^2}$$

more generally this distance (euclidean) holds across any number of dimensions d :

What is the size of

$$v = [1 \ 3 \ 4 \ 2]^T$$

$$|v| = \sqrt{(1)^2 + (3)^2 + (4)^2 + (2)^2} = \sqrt{30}$$

PROBLEM #2

What is $r = [-5 \ 3 \ 2 \ 8]^T$ dotted with $s = [1 \ 2 \ -1 \ 0]^T$

$$r \cdot s = -5(1) + 3(2) + 2(-1) + 8(0) = -1$$

PROBLEM #3

Scalar projection can happen in any dimension

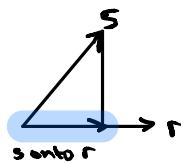

What is the scalar proj. of $r = [3 \ -4 \ 0]^T$ onto $s = [10 \ 5 \ -6]^T$

$$\text{scalar proj: } \frac{r \cdot s}{|r|} = |s| \cos \theta$$

$$r \cdot s = 3(10) + (-4)(5) + 0(-6)$$

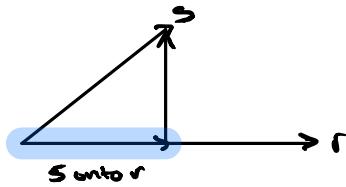

$$|r| = \sqrt{3^2 + (-4)^2 + 0^2}$$

$$\frac{r \cdot s}{|r|} = \frac{10}{5} = 2$$

"Want to find the size of the blue vector".
-scalar proj.

PROBLEM #4.

The vector proj.
is the blue vector.

What is the vector projection of $r = [3 \ -4 \ 0]^T$
 $s = [10 \ 5 \ -6]^T$?

vector proj. = $\frac{r}{|r|} \times \text{scalar proj.}$

$$r \cdot s = 3(10) + (-4)(5) + (0)(-6) \\ = 10$$

$$= \frac{r}{|r|} \times \frac{r \cdot s}{|r|}, \text{ or } \frac{r}{|r|} \times |s| \cos \theta$$

$$r \cdot r = (3)^2 + (-4)^2 + (0)^2 \\ = 25$$

$$= r \frac{r \cdot s}{r \cdot r}$$

$$r \frac{r \cdot s}{r \cdot r} = \begin{bmatrix} 3 \\ -4 \\ 0 \end{bmatrix} \frac{10}{25}$$

$$= \begin{bmatrix} 6/5 \\ -8/5 \\ 0 \end{bmatrix}$$

PROBLEM #5.

Which is larger given $a = [3 \ 0 \ 4]^T$ and $b = [0 \ 5 \ 12]^T$
is $|a+b|$ or $|a| + |b|$?

Options:

- I. $|a+b| < |a| + |b|$ (in this case).
- II. $|a+b| = |a| + |b|$
- III. $|a+b| > |a| + |b|$

$$|a| = \sqrt{(3)^2 + (0)^2 + (4)^2} = 5$$

$$|b| = \sqrt{(0)^2 + (5)^2 + (12)^2} = 13$$

$$a+b = [(3+0) \ (0+5) \ (4+12)]^T$$

$$|a+b| = \sqrt{3^2 + 5^2 + 16^2} = \sqrt{290}$$

Given the two vectors conjoined
have an angle between them
from $[0^\circ - 180^\circ]$, their addition
will either be synergistic or
otherwise.

Therefore $|a+b| \leq |a| + |b|$.

PROBLEM #6.

Which of the following statements about the dot-product are correct?

- The dot product is not commutative

(i.e. $s \cdot r \neq r \cdot s$) \Rightarrow dot prod = $\sum_{i=1}^n (s_i^i)(r_i^i)$. multiplication is always commutative

- The scalar projection of s -onto- r is always the same as r -onto- s .

$$\text{scalar proj of } r\text{-onto-}s = \frac{s \cdot r}{|s|} = |r| \cos \theta$$

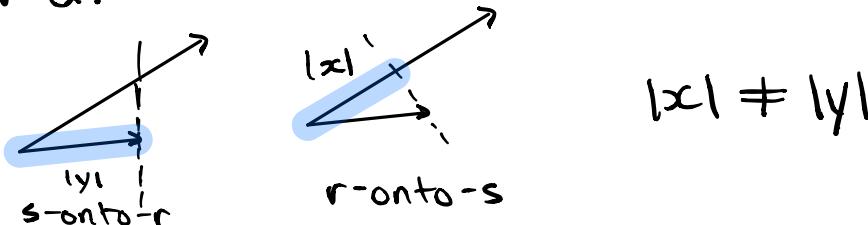

$$\text{scalar proj of } s\text{-onto-}r = \frac{r \cdot s}{|r|} = |s| \cos \theta$$

Both equations share $r \cdot s$, which is commutative.

But $|s|$ is not always equal to $|r|$.

Therefore the scalar projections are not always equal.

For ex.

- The vector proj of s -onto- r is equal to scalar proj of s -onto- r multiplied by vector of unit length with direction of r .

$$\begin{aligned} \text{vector proj} &= \frac{r}{|r|} \cdot \text{scalar proj.}, \text{ given this formula} \\ &= \frac{r}{|r|} \times \frac{r \cdot s}{|r|} \quad \text{the statement is} \\ &= r \frac{r \cdot s}{r \cdot r} \quad \text{true.} \end{aligned}$$

- ✓ We can find the angle between two vectors using the dot product.

$$\begin{aligned}
 \text{dot prod} &= \sum_i r_i s_i = \mathbf{r} \cdot \mathbf{s} \\
 &= |\mathbf{r}| |\mathbf{s}| \cos \theta, \text{ by equating the dot product and cosine rule (using vectors) and simplifying.}
 \end{aligned}$$

to get the angle between two vectors can

$$\text{dot prod} = x, \text{ some val}$$

$$\begin{aligned}
 \mathbf{r} \cdot \mathbf{s} = x &\iff x = |\mathbf{r}| |\mathbf{s}| \cos \theta \\
 &\iff \cos \theta = x \times \frac{1}{|\mathbf{r}| |\mathbf{s}|} \\
 &\quad \theta = \cos^{-1} \left(\frac{x}{|\mathbf{r}| |\mathbf{s}|} \right)
 \end{aligned}$$

Thus, you could find the angle using the dot prod and moduli of participating vectors.

- ✓ The size of the vector is equal to the square root of the dot product of the vector with itself.

Assume the converse,

$$|\mathbf{r}| = \sqrt{\mathbf{r} \cdot \mathbf{r}}$$

$$|\mathbf{r}| = \sqrt{\sum_i |\mathbf{r}_i|^2}$$

$$\begin{aligned}
 \sqrt{\mathbf{r} \cdot \mathbf{r}} &= \sqrt{|\mathbf{r}| |\mathbf{r}| \cos \theta} \\
 &= \sqrt{|\mathbf{r}| |\mathbf{r}| \cos(0)} \\
 &= \sqrt{|\mathbf{r}| |\mathbf{r}| (1)} \\
 &= \sqrt{|\mathbf{r}|^2} \\
 &= |\mathbf{r}|
 \end{aligned}$$

Therefore $|\mathbf{r}| = \sqrt{\mathbf{r} \cdot \mathbf{r}}$ is false and the hypothesis must be true!
