
PROBLEM #1

Calc. the gradient of a linear function which has the points $(8, 6), (2, 0)$

$$f(x) = mx + b$$

$$0 = m(2) + b$$

$$6 = m(8) + b$$

$6 = m(6)$, substituting $m(2) = -b$ from eq. 1.

$$m = 6/6$$

Therefore the gradient is 1.

$$(8-2)1 + 0 = 6, \text{ the } y\text{-val of } (8, 6).$$

□.

PROBLEM #2.

Given the function $f(x) = -x^2 + 8$, plot the gradient of this function.

PROBLEM #3.

Plot the derivative of this function,

PROBLEM # 4.

Do vertical shifts in a function affect its derivative?

No.

PROBLEM # 5.

Draw a antiderivative of (generalized)
no y offset

constant rate of change.
